

Business Problem Statement

Customer Behavior Analysis Using SQL, Python and Power BI

Executive Summary

Retail and e-commerce organizations generate large volumes of customer transaction data every day. Despite having access to significant amounts of data, many businesses struggle to transform raw information into actionable insights. As a result, decision-makers often face challenges in understanding customer preferences, purchasing behavior, product performance, and revenue trends. This project aims to address these challenges through comprehensive customer behavior analysis.

Problem Statement

The organization lacks a clear understanding of customer purchasing patterns, spending habits, product preferences, and factors influencing customer satisfaction. Without detailed analysis, business teams may miss opportunities to improve sales performance, optimize inventory, increase customer retention, and enhance marketing effectiveness.

Business Challenges

- Difficulty identifying high-value customers.
- Limited visibility into product and category performance.
- Inability to track customer satisfaction trends effectively.
- Challenges in understanding seasonal sales patterns.
- Lack of data-driven decision-making for marketing campaigns.
- Insufficient insights into customer loyalty and retention.

Project Objectives

The primary objectives of this project are:

- Analyze customer demographics and purchasing behavior.
- Identify top-performing products and categories.
- Measure customer satisfaction through ratings and reviews.
- Discover seasonal and behavioral sales trends.
- Evaluate customer loyalty and repeat purchase behavior.
- Develop interactive dashboards for business monitoring.
- Provide recommendations to improve business performance.

Scope of Analysis

The analysis covers customer transactions, product purchases, ratings, demographic information, and shopping behavior. The project uses data cleaning, exploratory data analysis, SQL-based querying, and visualization techniques to uncover patterns and generate business insights.

Expected Outcomes

Upon completion, the project is expected to provide:

- Better understanding of customer buying behavior.
- Identification of revenue-driving products and segments.
- Improved decision-making through KPI dashboards.
- Actionable recommendations for sales and marketing teams.
- Enhanced customer engagement and retention strategies.
- Data-driven business planning and forecasting.

Business Impact

The insights generated from this analysis can help organizations optimize inventory, improve customer targeting, increase operational efficiency, and maximize profitability. By leveraging data-driven strategies, businesses can make informed decisions that support long-term growth and customer satisfaction.

Conclusion

Customer behavior analysis plays a critical role in understanding how customers interact with products and services. This project provides a structured approach to transforming raw transactional data into meaningful insights that support strategic business decisions and improve overall organizational performance.
